

A Guide to Looking at Transportation Model Plots

The transportation model network for auto and transit is not all streets, but collectors and above.

Please see the example plot below. The streets included in the transportation network are in black and the data posted is by direction and indicate - Number of Lanes, Free Flow Speed (not necessarily posted speed), modeled hourly Capacity. The planning capacity is largely determined by TRMS staff to maintain consistency across the region, but if you have count information that exceeds the listed capacity we would like to know.

If you have questions or need more detailed plots please contact-
